

ABSTRACT OF THE DISCLOSURE

**SYSTEM, METHOD, AND PROGRAM PRODUCT FOR SAVING A SUBMITTED
FORM OF A WEB PAGE**

5 A system, method, and program product of the invention enables saving a submitted form of a web page. The browser application according to the present invention is executed in a client system and receives from a user data for a form in a web page. If the user activates a submission of the form with the data to a server system 10 hosting the web page, an address of the web page, the data provided from the user for the form, and at least one field identifier for associating the data to at least one respective field of the form, are saved into a volatile memory system of the client system. The address, the data, and the at least one field identifier are still stored in the volatile memory system after the browser application is closed. When the user opens the browser application that had been closed and again requests retrieval of the web page, the browser application retrieves from the server system the web page that is at the address stored in the volatile memory system. The browser application restores the form of the web page with the data stored in the volatile memory system. The 25 browser application calls a clipboard operation of an operating system on which the client system operates to save the address of the web page, the data for the form, and the one or more field identifiers, into the volatile memory system. If the data for the form is successfully submitted to the server system and the browser application receives another request for a next web page from the user, the browser application erases, if required, the 30 data from the volatile memory system.
